

What is claimed is:

1. A method for providing an ion-implanted semiconductor substrate comprising:
5 providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,
wherein the photoresist comprises a resin that comprises, prior to photoactivation, photoacid-labile moieties that are spaced by at least 1 atom from the resin backbone; and
applying ions to the substrate.
10
2. A method for providing an ion-implanted semiconductor substrate comprising:
providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,
15 wherein the photoresist comprises, prior to photoactivation, a resin that comprises units that contain photoacid-labile moieties in an amount of 12 mole percent or less, based on total units of the resin; and
applying ions to the substrate.
- 20 3. A method for providing an ion-implanted semiconductor substrate comprising:
providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,
wherein the photoresist comprises, prior to photoactivation, a resin that comprises
25 units that contain photoacid-labile moieties that have multiple covalent linkages to the resin prior to a photoacid-deblocking reaction; and
applying ions to the substrate.
- 30 4. A method for providing an ion-implanted semiconductor substrate comprising:
providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,

wherein the photoresist comprises, prior to photoactivation, one or more components that are covalently linked by a group that can be cleaved by exposure and/or photogenerated acid; and
applying ions to the substrate.

5

5. A method for providing an ion-implanted semiconductor substrate comprising:

providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,

10 wherein the photoresist comprises, prior to photoactivation, photoacid-labile groups that generate upon photoactivation a cleavage product that comprises 5 or more carbon atoms and/or a single or multiple ring structure; and
applying ions to the substrate.

15 6. A method for providing an ion-implanted semiconductor substrate comprising:

providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,

20 treating the photoresist composition image thermally or with radiation to remove volatile materials of the photoresist composition; and
applying ions to the substrate.

7. A method for providing an ion-implanted semiconductor substrate comprising:

25 providing a semiconductor substrate having coated thereon a relief image of chemically-amplified positive-acting photoresist composition,

treating the photoresist composition image to provide a coating thereon; and
applying ions to the substrate.

8. A coated substrate comprising:
a semiconductor wafer having coated thereon a relief image of chemically-amplified positive-acting photoresist composition that comprises a resin that comprises, prior to photoactivation, photoacid-labile moieties that are spaced by at least 1 atom from
5 the resin backbone; and
the wafer having applied dopant ions.

9. A coated substrate comprising:
a semiconductor wafer having coated thereon a relief image of chemically-amplified positive-acting photoresist composition that comprises, prior to
10 photoactivation, a resin that comprises units that contain photoacid-labile moieties in an amount of 12 mole percent or less, based on total units of the resin; and
the wafer having applied dopant ions.

15 10. A coated substrate comprising:
a semiconductor wafer having coated thereon a relief image of chemically-amplified positive-acting photoresist composition that comprises, prior to photoactivation, a resin that comprises units that contain photoacid-labile moieties that have multiple covalent linkages to the resin prior to a photoacid-deblocking reaction; and
20 the wafer having applied dopant ions.

11. A coated substrate comprising:
a semiconductor wafer having coated thereon a relief image of chemically-amplified positive-acting photoresist composition that comprises, prior to
25 photoactivation, one or more components that are covalently linked by a group that can be cleaved by exposure and/or photogenerated acid; and
the wafer having applied dopant ions.

12. A coated substrate comprising:
30 a semiconductor wafer having coated thereon a relief image of chemically-amplified positive-acting photoresist composition that comprises, prior to photoactivation, photoacid-labile groups that generate upon photoactivation a cleavage

product that comprises 5 or more carbon atoms and/or a single or multiple ring structure;
and

the wafer having applied dopant ions.

5 13. A coated substrate comprising:

a semiconductor wafer having coated thereon a relief image of chemically-
amplified positive-acting photoresist composition that is coated; and

the wafer having applied dopant ions.

10 14. A coated substrate of any one of claims 8 through 13 wherein the

photoresist composition coating has a dried layer thickness of about 3 microns or greater.

15 15. A chemically-amplified positive-acting photoresist composition that
comprises one or more photoacid generator compounds and a resin that comprises units
that contain photoacid-labile moieties in an amount of 8 mole percent or less, based on
total units of the resin.

20 16. A chemically-amplified positive-acting photoresist composition that
comprises one or more photoacid generator compounds and a resin that comprises units
that contain photoacid-labile moieties that have multiple covalent linkages to the resin
prior to a photoacid-deblocking reaction.

25 17. A chemically-amplified photoresist comprising one or more photoacid
generator compounds and one or more components that are covalently linked by a group
that can be cleaved by exposure and/or photogenerated acid.

30 18. A chemically-amplified positive-acting photoresist composition that
comprises one or more photoacid generator compounds and a resin that comprises units
that contain photoacid-labile moieties in an amount of 8 mole percent or less, based on
total units of the resin.

19. A chemically-amplified positive-acting photoresist composition that comprises one or more photoacid generator compounds and a resin that comprises units that contain photoacid-labile moieties that have multiple covalent linkages to the resin prior to a photoacid-deblocking reaction.
